

Proposal: DHL MyDHL API Integration for Automated Airwaybill Creation and Consignee Validation

Introduction

DHL has introduced the MyDHL API, which enables organizations to integrate shipment processes directly with DHL's global logistics platform. This API supports automated shipment creation, airwaybill generation, label printing, tracking, and other courier functions without requiring manual input through the DHL+ portal.

Given this capability, there is an opportunity to enhance the current manual airwaybill creation process by leveraging DHL API integration to improve operational efficiency, strengthen control mechanisms, and reduce the risk of misdirected shipments across global operations.

1. Current Issue / Problem Statement

Currently, airwaybills are manually created in DHL+ for document dispatch.

Users are required to:

- Select consignee details from the DHL address book for existing recipients, or
- Manually create and key in new consignee information for new recipients and save them into the address book.

As this process relies heavily on manual selection and data entry within DHL+, there is a risk of:

- Selecting incorrect consignee records from the address book.
- Entering inaccurate recipient details during manual creation.
- Dispatching documents to the wrong recipient or destination.
- Reusing incorrect or incomplete address records in future shipments.

Given the manual nature of the process and global usage, such errors may result in shipment delays, operational inefficiencies, customer complaints, confidentiality breaches, and reputational risk.

5. Expected Outcome

- Significant reduction in misdirected shipment incidents.
- Improved accuracy and reliability of consignee and shipment data.
- Enhanced preventive controls through system validation and API integration.
- Reduced operational, confidentiality, and reputational risks.
- Faster and more efficient airwaybill generation process.
- Improved user experience with reduced manual effort.
- Establishment of a standardized global shipment process supported by automation.

Business Justification

The current DHL+ manual airwaybill creation process relies heavily on user input and address book selection, which introduces operational risk and potential for human error.

Leveraging DHL MyDHL API provides an opportunity to fully automate shipment creation and strengthen validation controls before dispatch. This will significantly reduce manual intervention, improve accuracy, and enhance operational resilience.

As DHL is used globally across multiple regions, this enhancement has strong potential for enterprise-wide adoption, enabling a standardized, efficient, and controlled global shipment process while reducing operational risk and improving service quality.

Given the average daily volume of approximately 40–60 consignments, even a small reduction in manual processing time per shipment can result in meaningful productivity savings. By automating airwaybill creation and applying system-driven validation before dispatch, the proposed enhancement will reduce reliance on manual maker-checker review, minimize rework, prevent avoidable courier correction costs, and strengthen preventive controls. This supports a more sustainable, scalable, and risk-controlled shipment process.

In addition, the benefit of this enhancement would not be limited to one country only. As DHL courier services and similar shipment processes are used by all SCB group the enhanced system capability can potentially be adopted across other locations to achieve consistent controls, improved efficiency, and reduced shipment-related risks on a wider scale.
